SubmittedTo:
Prof. Jitesh Solanki

Coding Diagram

Code Explanation

1. CSV File Setup

- A CSV file (booking_data.csv) is used as the **database** to store all booking records.
 - If the file doesn't exist, it initializes the file with headers like Name, Booking ID, etc.
-

2. Styling and Layout

- Global styling uses constants for background color, button style, and font.
 - Styling is applied uniformly across widgets using `setStyleSheet()`.
-

3. Login Page (LoginPage)

- A simple login form with username and password fields.
 - If correct credentials (vishal and 2318) are entered, the user is allowed into the admin dashboard.
 - Otherwise, an error message is shown.
-

4. Admin Dashboard (AdminPage)

- Displays three buttons:
 - **Create Booking:** Goes to the booking form.
 - **Manage Bookings:** Goes to the booking manager.
 - **Logout:** Returns to login page.
-

5. Create Booking Page (CreateBooking)

- Form with input fields for all required booking details (Name, ID, Class, etc.).

- On submission:
 - Data is validated (no empty fields).
 - Data is saved into the booking_data.csv.
 - Confirmation message is shown.
-

6. Manage Bookings Page (ManageBookings)

Includes the following features:

- **Search by Booking ID:** Filters and displays matching row.
 - **View All:** Loads and displays all data from CSV.
 - **Update:**
 - User edits a selected row directly in the table.
 - Saves the updated data back to the CSV.
 - **Delete:**
 - Deletes selected booking after confirmation.
 - **Sort by Cost:**
 - Sorts all records by the "Cost" column (as float).
 - **Export:**
 - Backs up all booking records into a new file backup_bookings.csv.
-

7. Stack-Based Navigation

- QStackedWidget is used to switch between pages like:
 - Login → Admin → Create/Manage
 - This avoids opening multiple windows and gives a **single-window app experience**.
-

8. Main Execution

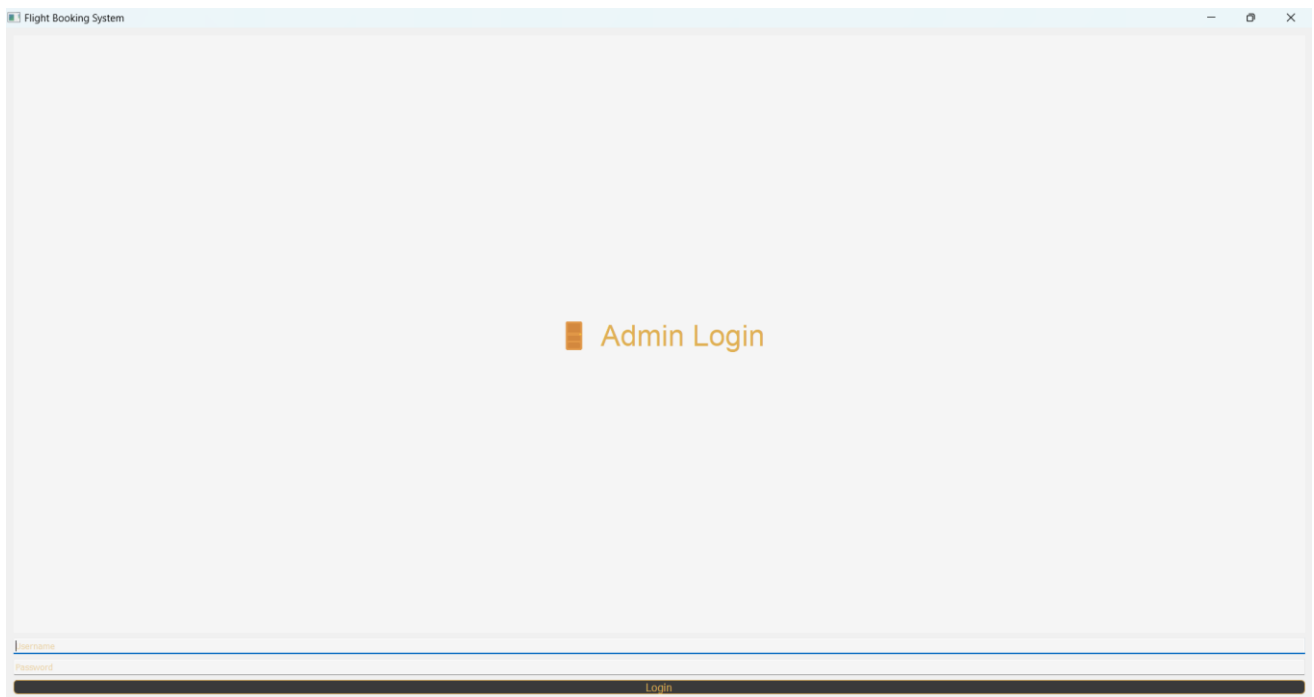

- Initializes the app, adds all widgets to the stack, shows the

main window, and starts the app loop.

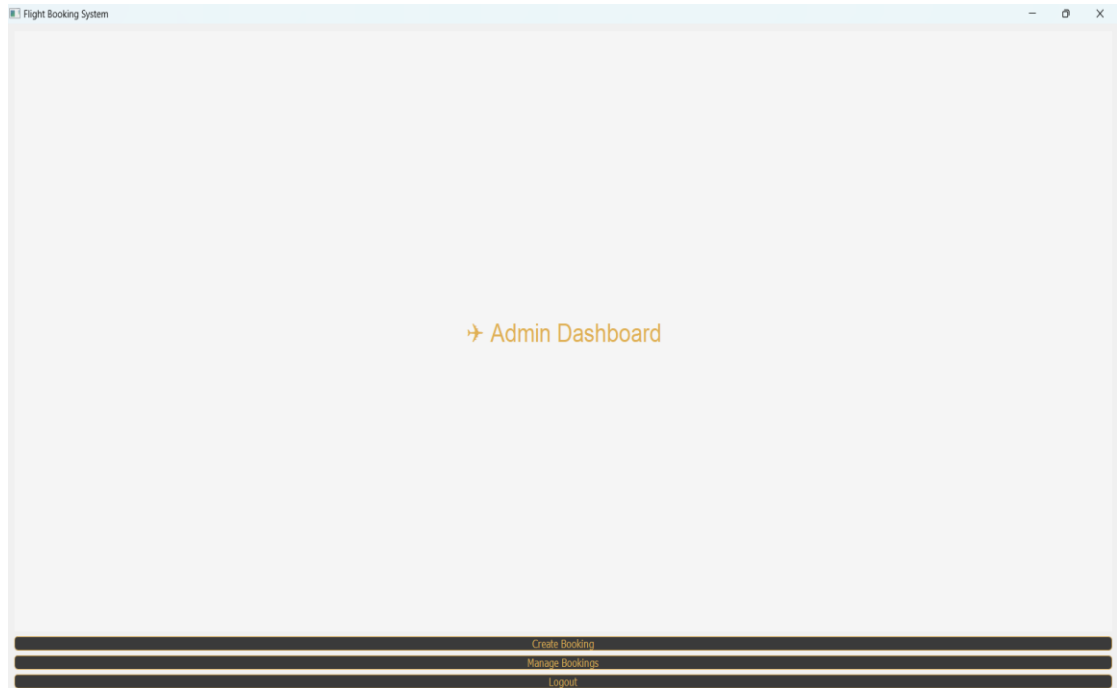

✓ Summary of Functionalities:

- Admin Login
- Booking Creation
- Data Validation
- Search/View/Update/Delete Bookings
- Sort by Cost
- Export to CSV
- Stacked page navigation in a single GUI window

Output Photos :

Admin login Page:

After Login Page:

The screenshot shows a web application window titled "Flight Booking System". Inside, there is a form with the following fields: Name, Booking ID, Class, Seat, Cost, Destination, and Flight Date. Each field has a corresponding input area. Below the form, there are two buttons: "Create Booking" and "Back". The "Back" button has a blue arrow icon. The form is set against a light gray background.

Create Booking Page:

File Handling Data Store To Csv:

Conclusion :

This project, Flight Booking System, provides an admin interface to create, manage, and track flight bookings using a simple GUI built in PyQt5 and data storage in CSV.

It demonstrates the use of Python's GUI programming, file handling, and modular class-based design. The project enhances understanding of GUI event-driven programming and file I/O operations in Python.
